Comprehensive Tissue Management Treatment Solutions

Endobon® Xenograft Granules With OsseoGuard® & OsseoGuard Flex® Barrier Membranes
• Bovine-derived hydroxyapatite that has been fully deproteinized by a two-step, high temperature process for safety.

• An essentially non-resorbable material that is ideally suited for regeneration of bone defects when effective space maintenance is required.

• Osseoconductive due to the interconnecting micro and macro pores for bony integration, which facilitate graft stability and vascular ingrowth.

• Packaged in easy to open dishes. Large volumes (5ml and 8ml) are individually packaged in 1ml containers for sterility.

• Endobon Xenograft Granules adhere to one another when hydrated for easy transfer to the defect.

• SEM images of Endobon Xenograft Granules at 20x and 100x showing the micro and macro pores in the particles.

Endobon® Xenograft Granules Are Indicated For Dental And/Or Oral Surgical Procedures, Such As:

• Alveolar ridge augmentation/reconstruction
• Filling of bone defects after root resection, cystectomy and apicectomy
• Filling socket after tooth extraction
• Sinus elevation

Manufacturer: BIOMET® France Sarl
OsseoGuard® Membranes

- Resorbable collagen membranes designed for optimal strength, resorption, handling and biocompatibility.
- Made of highly purified collagen from safe bovine sources.
- A unique manufacturing process provides both membranes with a long resorption profile (6–9 months); well suited for Guided Bone Regeneration (GBR) procedures.
- OsseoGuard Membranes provide a protective barrier against soft-tissue invasion of a defect space.
- Two different levels of flexibility for ease of use in various clinical scenarios.
- Ability to tack or suture if desired.
- Three sizes are supplied sterile and are in double peel pouches for different defect sizes.

OsseoGuard
- Slightly more rigid for space maintenance.
- Extraction sockets
- Coverage of sinus window and sinus membrane perforations
- Localized ridge augmentation
- Ability to tack or suture if desired.

OsseoGuard Flex
- Less extrinsic crosslinking for a higher degree of flexibility.
- Alveolar ridge reconstruction
- GBR in dehiscence defects
- GTR in periodontal defects

Indications:
- Extraction sockets
- Coverage of sinus window and sinus membrane perforations
- Localized ridge augmentation
- Alveolar ridge reconstruction
- GBR in dehiscence defects
- GTR in periodontal defects

“...The consistency and tear resistance are very good, even when wet."

Manufacturer: Collagen Matrix, Inc., Oakland, NJ
OsseoGuard® Membrane

- The OsseoGuard Membrane is designed for optimal strength, resorption and handling.
- Made of highly purified Type I collagen, derived from bovine Achilles tendon.

This provides:
- Optimal strength to support suturing and good handling characteristics.
- A suture pull-out strength that is significantly higher than that of BioMend® due to its unique fibrillar matrix structure.¹
- A long resorption profile (6–9 months) suited for the healing time required in many GBR procedures.²

Clinical Images Provided By: Dr. Francisco Enrile, Huelva, Spain.

• A long resorption profile (6–9 months) suited for the healing time required in many GBR procedures.²

Fig. 1: Clinical appearance of the surgical site at the time of implant placement four weeks after tooth extraction.

Fig. 2 & 3: The osseous defects were grafted with autogenous bone and Endobon® Xenograft Small Granules. The surgical site was covered with an OsseoGuard 20x30mm Resorbable Collagen Membrane.

Fig. 4: The surgical site was closed with sutures.

Fig. 5: Clinical appearance one month post-implant placement. Good epithelialization of the soft tissue is observed.

Fig. 6: Three months post-implant placement, the soft tissue has healed completely. The implants are ready for second stage surgery and healing abutment connection.

Fig. 7: Placement of the definitive restoration five months post-surgery.

Fig. 8: Clinical appearance nine months post-surgery. Note the healthy soft tissues.

Fig. 9: Periapical radiograph taken nine months post-surgery. Note the regenerated bone and graft integration.

Clinical Images Provided By: Dr. Francisco Enrile, Huelva, Spain.
The OsseoGuard Flex Membrane is designed for optimal strength and drapability, resorption, and handling.

Made of Type I and Type III collagen, highly purified from intact bovine dermis.

This provides:

- Optimal flexibility to drape over the defects.
- A long resorption profile (6–9 months) suited for the healing time required in many GBR procedures.¹
- The ability to aid in gingival healing even when left exposed in a posterior molar extraction site.²

Histological Study of Endobon® Xenograft Granules in Sinus Floor Augmentation

“The Clinical and Histological Efficacy of Xenograft Granules for Maxillary Sinus Floor Augmentation”, a study led by Dr. Myron Nevins† at the Harvard School of Dentistry published in The International Journal Of Periodontics & Restorative Dentistry (2011 Jun;31(3):227-235), highlights the positive results that clinicians achieved when using Endobon Xenograft Granules in patients requiring sinus augmentation procedures prior to implant placement.

At six months postoperatively, the following observations were made:

• Bone formation at the osteotomy site ranging from 16.2% to 43.6% was observed in all patients.
• Histologic evaluation showed Endobon Xenograft Granules to be integrated and surrounded by woven bone and in close contact with the particles.
• No inflammatory cells were present and there were no signs of Xenograft resorption.
• Evidence was observed of woven bone undergoing remodeling and maturing to well-organized lamellar bone.

† These clinicians have current or past financial relationships with BIOMET 3i LLC resulting from speaking engagements, consulting engagements and other retained services.
